Novel high molecular weight Dermatophagoides nucleic acid polypeptides used to modify an animals' hypersensitivy to mite allergens.

Claim 3; Page 111-113; 154pp; English.

This sequence represents Dermatophagoides farinae mite allergen protein (map) PDerf98-555. PDerf98-555 has a molecular weight of 98 kD, comprising 555 amino acids, and is a component of the Dermatophagoides

```
farinae high molecular weight mite allergen protein (HWM-map)

composition. The HWW-map composition was isolated from a D. farinae
homogenate by gel filtration, with each fraction being analysed for the
presence of proteins that bound to IgE present in mite-allergic dog
antisera. Mite allergenic proteins and peptides, and mucleic acids
encoding them, may be used in therapautic compositions to modify an
c encoding them, may be used in therapautic compositions to modify an
c nimal's hypersensitivity reaction to mite allergens. Animals that may be
treated include mammals and birds, especially felines, canines, equines,
thumans, other pets, and work or domestic animals. The proteins may also be used to diagnose allergies via a skin test. The
proteins and peptides can also be used to raise antibodies, which have a
variety of potential uses. For example, they can be used as vaccines to
passively immunise animals against dust mite hypersensitivity, as
positive controls in test kits and as tools to recover desired dust mite
allergens from a mixture of proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      360
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              420

```

The invention relates to an isolated mite allergenic protein of Dermatophagoides, designated Der HWW-map protein, and its related mucleic acid. The Der HWW-map protein is useful for eliciting an immune response against Der HWW-map protein. The protein or a reagent comprising a non-proteinaceous epitope is useful for identifying an animal (e.g., dog, cat) susceptible to or having an allergic response to a mite. A therapeutic composition is useful for desensitising a host animal to an allergic response to a mite. The DNA and protein can be used in the allergic response to a mite. The DNA and protein can be used in the chemunoglobulin (Ig)E or Der HWW-map protein activity associated with a disease. Antibodies that bind to Der HWW-map are useful for inhibition binding of proteins to IgE, to prevent immunocomplex formation, thus reducing hypersensitivity responses to mite allergens, and as vaccines against mite allergen hypersensitivity. Sequences AAU96314-AAU96312 New mite allergenic protein isolated from Dermatophagoides, designated Der HMW-map protein, useful as a vaccine for treating mite allergy. 121 EGSEKYSDMAANPTYRQOFIQSVLDFLQBYKFDGLDLDWEYPGSRLGNPKIDKQNYLALV 241 PLYKRPDETDELHTYFNVNYTMHYYLNNGATRDKLVMGVPFYGRAWSIEDRSKLKLGDPA 1 MKTIYAILSIMACIGLMNASIKRDHNDYSKNPMRIVCYVGTWSVYHKVDPYTIEDIDPFK 181 RELKDAFEPHGYLLTAAVSPGKDKIDRAYDIKELNKLFDWMNVMTYDYHGGWENFYGHNA PLYKRPDETDELHTYFNVNYTMHYYLNNGATRDKLVMGVPFYGRAWSIEDRSKLKLGDPA KGMSPPGFISGEEGVLSYIELCQLFQKEEWHIQYDEYYNAPYGYNDKIWVGYDDLASISC 301 KGMSPPGFISGEEGVLSYIELCQLFQKBEWHIQYDEYYNAPYGYNDKIWVGYDDLASISC 1 MKTIYAILSIMACIGLANASIKRDHNDYSKNPMRIVCYVGTWSVYHKVDPYTIEDIDPFK CTHLMYGFAKIDEYKYTIQVFDPYQDDNHNSWEKRGYERFNNLRLKNPELTTMISLGGWY 61 CTHIMYGFAKIDEYKYTIQVFDPYQDDNHNSWEKRGYERFNNLRLKNPELTTMISLGGWY EGSEKYSDMAANPIYRQQFIQSVLDFLQEYKFDGLDLDWEYPGSRLGNPKIDKQNYLALV RELKDAFEPHGYLLTAAVSPGKDKIDRAYDIKELNKLFDWMNVMTYDYHGGWENFYGHNA Der HMW-map; American house dust mite; antiallergic; mite; IgE; mite allergenic protein; immunoglobulin E; hypersensitivity; immunocomplex formation. ; Score 3107; DB 5; ; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 엄
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to an isolated mite allergenic protein of Dermatophagoides, designated Der HWW-map protein, and its related nucleic acid. The Der HWM-map protein is useful for alloiting an immune response against Der HWW-map protein. The protein or a reagant comprising a non-protein susceptible to or having an allergic response to a mite. A therapeutic composition is useful for identifying an animal (e.g., A therapeutic composition is useful for desensitising a host animal to an allergic response to a mite. The DNA and protein can be used in the callergic response to a mite. The DNA and protein can be used in the callergic response to a mite. The DNA and protein can be used in the callergic fanti-Der HWW-map protein activity associated with a cisease. Antibodies that bind to Der HWW-map are useful for inhibiting binding of proteins to IgE, to prevent immunocomplex formation, thus reducing hypersensitivity responses to mite allergens, and as vaccines against mite allergen hypersensitivity. Sequences ANU963142 represent Der HWW-map polypeptides of the invention

```
This sequence represents Dermatophagoides farinae mite allergen protein

(map) PDerf98-536, the mature form of PDerf98-555 (AAY5523). PDerf98-536

(map) PDerf98-536, the mature form of PDerf98-555 (AAY5523). PDerf98-536

(has a molecular weight of 98 kD, comprising 536 amino acids, and is a

component of the Dermatophagoides farinae high molecular weight mite

allergen protein (HWM-map) composition. The HMW-map composition was

isolated from a D. farinae homogenate by gel filtration, with each

craction being analysed for the presence of proteins that bound to IgB

present in mite-allergic dog antisera. Wite allergenic proteins and

peptides, and moleler acids encoding them, may be used in therapeutic

compositions to modify an animal's hyperensitivity reaction to mite

allergens. Animals that may be treated include mammals and birds,

compositions compositions, ordines, chumans, other pets, and work or

allergies via a skin test. The proteins and peptides can also be used to

cause antibodies, which have a variety of potential uses. For example,

they can be used as vaccines to passively immunise animals against dust

mite hypersensitivity, as positive controls in test kits and as tools to

recover desired dust mite allergens from a mixture of proteins
                                                                                  Novel high molecular weight Dermatophagoides nucleic acid polypeptides used to modify an animals' hypersensitivy to mite allergens.
                                                                                                                                                                      Claim 3; Page 125-127; 154pp; English.

The invention relates to an isolated mite allergenic protein of Dermatophagoides, designated Der HWW-map protein, and its related nucleic acid. The Der HWW-map protein is useful for eliciting an immune response against Der HWW-map protein. The protein or a reagent comprising a nonpresing susceptible to or having an allergic response to a mite. A therapeutic composition is useful for identifying an animal (e.g., dog, cat) susceptible to or having an allergic response to a mite. A therapeutic composition is useful for desensitising a host animal to an allergic response to a mite. The DNA and protein can be used in the categoric and anti-Der HWW-map antibodies in animal fluids, and inhibition of immunoglobulin (Ig)E or Der HWW-map protein activity associated with a disease. Antibodies that bind to Der HWW-map are useful for inhibiting binding of proteins to IgE, to prevent immunocomplex formation, thus reducing hypersensitivity responses to mite allergens, and as vaccines against mite allergen hypersensitivity. Sequences AAU96314-AAU96312 represent Der HWW-map polypeptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 61 VFDPYQDDNHNSWEKRGYERFNNLRLKNPELLTMISLGGWYEGSEKYSDMAANPTYRQQF 120

modify an animal's hypersensitivity reaction to mite allergens. Animals that may be treated include mammals and birds, especially felines, canines, humans, other pets, and work or domestic animals. The proteins or fragments may also be used to diagnose allergies via a skin test. The proteins and peptides can also be used to raise antibodies, which have a variety of potential uses. For example, they can be used as vaccines to passively immunise animals against dust mite allerge shypersensitivity, as positive controls in test kits and as tools to recover desired dust mite allergens from a mixture of proteins.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence represents Dermatophagoides pteronyssius mite allergen protein (map) PDerp98-509. PDerp98-509 has a molecular weight of 98 KD, comprising 509 amino acids, and has a high degree of homology with the D farinae 98 kD allergen, map8 (AAYE2523). Nucleic acid molecules encoding PDerp98-509 were isolated from a D. pteronyssius cDNA library by Mybridisation with a probe encoding the D. farinae high molecular weight map (HWW-map) composition. Mite allergenic proteins and peptides, and nucleic acids encoding them, may be used in therapeutic compositions to

The invention relates to an isolated mite allergenic protein of Dermatophagoides, designated Der HWW-map protein, and its related nucleic acid. The Der HWW-map protein is useful for allciting an immune response against Der HWW-map protein. The protein or a reagant comprising a nonproteinaceous epitope is useful for identifying an animal (e.g., dog, cat) susceptible to or having an allergic response to a mite. A learned of the composition is useful for identifying an animal to an allergic response to a mite. The DNA and protein can be used in the allergic response to a mite. The DNA and protein can be used in the detection of anti-Der HWW-map protein activity associated with a disease. Antibodies that bind to Der HWW-map protein activity associated with a binding of proteins to IgE, to prevent immunocomplex formation, thus reducing hypersensitivity responses to mite allergens, and as vaccines against mite allergen hypersensitivity. Weber ER; Mccall CA, Hunter SW,

2002-351888/38. N-PSDB; ABK69583 New mite allergenic protein isolated from Dermatophagoides, designated Der HMW-map protein, useful as a vaccine for treating mite allergy.

Claim 12; Page 139-141; 161pp; English

The invention relates to an isolated mite allergenic protein of Dermatophagoides, designated Der HWW-map protein, and its related nucleic acid. The Der HWM-map protein is useful for eliciting an immune response against Der HWM-map protein. The protein or a readent comprising a nonpresence susceptible to or having an allergic response to a mite. A therapeutic composition is useful for identifying an animal (e.g., dog, therapeutic composition is useful for desenatising a host animal to an allergic response to a mite. The DNA and protein can be used in the allergic anti-Der HWM-map antibodies in animal fluids, and inhibition of immunoglobulin (Ig)E or Der HWM-map protein activity associated with a disease. Antibodies that bind to Der HWM-map are useful for inhibiting binding of proteins to IgE, to prevent immunocomplex formation, thus reducing hypersensitivity responses to mite allergens, and as vaccines against mite allergen hypersensitivity. This sequence represents Dermatophagoides pteronyssius mite allergen protein (map) Poerp98-490, the mature form of pDerp98-509. Poerp98-490 and has a molecular weight of 98 kD, comprising 490 amino acids, and has a high degree of homology with the D. farinae mature 98 kD allergen, map8 (AAY52525). Nucleic acid molecules encoding PDerp98-490 were isolated from a D. pteronyssius cDNA library by hybridisation with a probe encoding the D. farinae high molecular weight map (HWW-map) composition. Mite allergenic proteins and peptides, and nucleic acids encoding them, may be used in therapeutic compositions to modify an animal, s hypersensitivity reaction to mite allergens. Animals that may be treated include mammals and birds, especially felines, canines, equines, humans, other pets, and work or domestic animals. The proteins and peptides can also be used to diagnose allergies via skin test. The proteins and peptides can also be used to diagnose allergies wish skin test. The proteins and potential uses. For example, they can be used as vaccines to passively immunise animals against dute mite hypersensitivity, as positive controls in test kits and as tools to recover desired dust mite allergens from a mixture of proteins. (Updated on 06-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       141

                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an isolated mite allergenic protein of Dermatophagoides, designated Der HWW-map protein, and its related nucleic acid. The Der HWW-map protein is useful for aliciting an immune response or against Der HWW-map protein. The protein or a reagant comprising a nonproteinst Der HWW-map protein or a reagant comprising a nonproteinst susceptible to or having an allergic response to a mite. A therapeutic composition is useful for identifying an animal lituids, and inhibition allergic response to a mite. The DNA and protein can be used in the allergic response to a mite. The DNA and protein can be used in the composition is useful for mainal fullids, and inhibition of immunoglobulin (Ig) or Der HWW-map protein activity associated with a disease. Antibodies that bind to Der HWW-map are useful for inhibiting binding of proteins to Igs, to prevent immunocomplex, formation, thus creducing hypersensitivity responses to mite allergens, and as vaccines against mite allergen hypersensitivity. Sequences AAU96314-AAU96342 represent Der HWW-map polypeptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DPPODDNHNSWEKHGYERFNNLRLKUPELTTMISLGGWYEGSEKYSDMAANPTYRQQFVQ 122

This protein is used in claimed fusion proteins of the invention. Such the translocating moiety and a toxic moiety, where the translocating moiety and a toxic moiety, where the translocating moiety is a plant protein (e.g. a lectin) capable of acting as a carrier to translocate the toxic moiety across the gut wall of a plant pathogen, and the toxic moiety is an insect-derived peptide or protein capable of causaing deleterious effects on growth, development, reproduction or mortality in pest insects. Suitable insect peptides and proteins include allatostatins, chitinase, diuretic hormone and their metabolites and analogues. Polymucleotides encoding the fusion protein, vectors, host cells and transgenic plants that are resistant to disease are also provided. The fusion protein is target-specific, and resists
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              305
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       484
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         466

                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-interactions in higher eukaryotes for the development of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   NGDEKNSFECILGPSTTTPTTTTPTTTPT------TPSPTT---PTTTP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 insecticides, therapeuties and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL36175) and the encoded proteins (ABBS7737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               2 KTIYAILSIMACIGLMNASIKRDHNDYSKNPMRIVCYVGTWSVYH----KVDPYTIEDID

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        An epidermal and gut chitinase (AAW01824) of Manduca sexta is encoded by CDNA clone 201 (AAT62557), isolated from a day-6 fifth instar whole larva cDNA library. The CDNA can be inserted into a vector for host expression of the chitinase protein, and may be utilised to control a population of insect pests. A recombinant baculovirus vector is provided for this purpose, as well as a transgenic tobacco plant that shows increased resistance to tobacco hornworm. Recombinant chitinase may also be expressed in host cells or larvae for subsequent purification and use as a biocide. The insect chitinase is expected to be more potent as an insect control agent than chitinases from other sources

```
The present sequence is the protein sequence for the Manduca sexta gut chitinase. It was used to isolate the Drosophila metanogaster imaginal disc growth factor 4 (IDGF4) coding sequence. IDGF4 is a member of the chitinase related proteins (CHRP) and is involved in the promotion of call growth, motility and morphogenesis. The gene and protein are expected to have mammalian homologues. They can be used in the treatment of cancer, wound healing, tissue regeneration following arthritis, osteoporosis, other skeletal disorders and burns, for revitalising scartissue resulting from surgical procedures, irradiation, laceration, toxic chemicals, viral or bacterial infection or burns, to promote tissue growth during tissue engineering, for example tissues for skin graft replacements and bone regiowth, and to modulate the function of the female reproductive tract. In addition, they can also be used to increase meat, egg, sperm and milk production in animals. One possible method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     497

The present sequence is that of Manduca sexta chitinase. This protein can be used in claimed fusion proteins of the invention. Such fusion proteins comprises a translocating moiety and a toxic moiety, where the translocating moiety is a plant protein (e.g. a lectin) capable of acting as a carrier to translocate the toxic moiety across the gut wall of a plant pathogen, and the toxic moiety is an insect-derived peptide or protein capable of causing deleterious effects on growth, development, reproduction or mortality in pest insects Suitable insect peptides and proteins include allatostatins, chitinase, diuretic hormone and their vectors, host cells and transgenic plants that are resistant to disease are also provided. The fusion protein is target-specific, and resists degradation in the insect gut
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                20,

Novel high molecular weight Dermatophagoides nucleic acid polypeptides used to modify an animals' hypersensitivy to mite allergens.

Claim 3; Page 125-127; 154pp; English.

This sequence represents Dermatophagoides farinae mite allergen protein (map) PDerf98-536, the mature form of PDerf98-555 (AAV52523). PDerf98-536 has a molecular weight of 98 KD, comprising 536 amino acids, and is a component of the Dermatophagoides farinae high molecular weight mite allergen protein (HWM-map) composition. The HWM-map composition was allergen protein (HWM-map) composition. The HWM-map composition was fixaction being analysed for the presence of proteins that bound to IgE present in mite-allergic dog antisera. Mite allergenic proteins and peptides, and nucleic acids encoding them, may be used in therapeutic

mite allergenic protein isolated from Dermatophagoides, designated HMW-map protein, useful as a vaccine for treating mite allergy.

compositions to modify an animal's hypersensitivity reaction to mite allergens. Animals that may be treated include mammals and birds, especially felines, canines, equines, humans, other pets, and work or domestic animals. The proteins or fragments may also be used to diagnose allergies via a skin test. The proteins and peptides can also be used to raise antibodies, which have a variety of potential uses. For example, they can be used as vaccines to passively immunise animals against dust mite hypersensitivity, as positive controls in test kits and as tools to recover desired dust mite allergens from a mixture of proteins

21-MAR-2002

The invention relates to an isolated mite allergenic protein of Dermatophagoides, designated Der HWW-map protein, and its related nucleic Dermatophagoides, designated Der HWW-map protein, and its related nucleic acid. The Der HWW-map protein is useful for eliciting an immune response companient ber HWW-map protein. The protein or a reagent comprising a non-protein capper is useful for identifying an animal (e.g., dog, cat) susceptible to or having an allergic response to a mite. A callergic response to a mite. A callergic response to a mite. A callergic response to a mite. The DNA and protein can be used in the detection of anti-Der HWW-map antibodies in animal fluids, and inhibition of immunoglobulin (Ig)E or Der HWW-map protein activity associated with a classe. Antibodies that bind to Der HWW-map are useful for inhibiting binding of proteins to IgE, to prevent immunocomplex formation, thus reducing hypersensitivity responses to mite allergens, and as vaccines against mite allergen hypersensitivity. Sequences AAU96314-AAU96342 represent Der HWW-map polypeptides of the invention ö 120 180 180 240 240 300 360 360 420 420 480 9 9 SIKRDHNDYSKNPMRIVCYVGIMSVYHKVDPYIIEDIDPFKCTHLMYGFAKIDEYKYTIQ PGKDKI DRAYDI KELNKI FDWMVMTYDYHGGWENFYGHNAPLYKRPDETDELHTYFNVN YTMHYYLNNGATRDKLVMGVPFYGRAWSIEDRSKLKLGDPAKGMSPPGFISGEEGVLSYI 141 YIWHYYLNNGATRDKLVMGVPFYGRAWSIEDRSKLKLGDPAKGMSPPGFISGEEGVLSYI ELCOLFOKEEWHIQYDEYYNAPYGYNDKIWGYDDLASISCKLAFLKELGVSGVMVWSLE NDDFKGHCGPKNPLLNKVHNMINGDEKNSFECILGPSTTTPTFTTFTTFTTPTTFSPT 536 SIKRDHNDYSKNPMRIVCYVGTWSVYHKVDPYTIEDIDPFKCTHLMYGFAKIDEYKYTIQ VFDPYQDDNHNSWEKRGYER FNNLRLKNPELTTMISLGGWYEGSEKYSDMAANPTYRQQF 61 VFDPYODDNHNSWEKRGYERFNNLRLKNPELTIMISLGGWYEGSEKYSDMAANPIYROOF IQSVLDFLQEYKFDGLDLDWEYPGSRLGNPKIDKQNYLALVRELKDAFEPHGYLLTAAVS 121 IQSVLDFLQEYKFDGLDLDWEYPGSRLGNPKIDKQNYLALVRELKDAFEPHGYLLTAAVS PGKDKIDRAYDIKELNKLFDWMNVMTYDYHGGWENFYGHNAPLYKRPDETDELHTYFNVN 361 NDDFKGHCGPKNPLLNKVHNMINGDEKNSFECILGPSTTTPTFTTTPTTTPTTTPSPT TPTTTPSPTTTPSPTTTPSPTTTPSPTTPTPTPAPTTSTPSPSPTTTBHTSETPKYTTY 536 Gaps VDGHLIKCYKEGDIPHPTNIHKYLVCEFVNGGWWVHIMPCPPGTIWCQEKLTCIGE 181 VDGHLIKCYKEGDIPHPTNIHKYLVCEFVNGGWWVHIMPCPPGTIWCQEKLICIGE ô Length 536; Indels 100.0%; Score 3014; DB 5; 100.0%; Pred. This sequence represents Dermatophagoides farinae mite allergen protein

(map) PDerf98-555. Poerf98-555 has a molecular weight of 98 kD,

comportains 555 amino acids, and is a component of the Dermatophagoides

composition. The RNW-map composition was isolated from a D. farinae

homogenate by gel filtration, with each fraction being analysed for the

presence of proteins that bound to IgB present in mite-allergic dog

corrected proteins that bound to IgB present in mite-allergic dog

antisera. Mite allergenic proteins and peptides, and nucleic acids

encoding them, may be used in therapeutic compositions to modify an

antisera. Mypersensitivity reaction to mite allergens. Animals that may be

created include mammals and birds, especially felines, canines,

humans, other petes, and work or domestic animals. The proteins or

fragments may also be used to diagnose allergies via a skin test. The

proteins and peptides can also be used to raise antibodies, which have a

variety of potential uses. For example, they can be used as vaccines to

possively immunise animals againet dust mite hypersensitivity, as

possively immunise animals againet dust mite brover desired dust mite

The invention relates to an isolated mite allergenic protein of

```
Dermatophagoides, designated Der HWW-map protein, and its related nucleic acid. The Der HWW-map protein is useful for eliciting an immune response against Der HWW-map protein. The protein or a reagent comprising a nonproteinaceous epitope is useful for identifying an animal (e.g., dog, cat) susceptible to or having an allergic response to a mite. A therapeutic composition is useful for deensitising a host animal to an allergic response to a mite. The DNA and protein can be used in the detection of anti-Der HWW-map protein activity associated with a disease. Antibodies that bind to Der HWW-map are useful for inhibition of immunoglobulin (Ig)E or Der HWW-map protein activity associated with a disease. Antibodies that bind to Der HWW-map are useful for inhibiting reducing hypersensitivity responses to mite allergens, and as vaccines against mite allergen hypersensitivity. Sequences AAU96314-AAU96342 represent Der HWW-map polypeptides of the invention
